PROFILE

I am a highly enthusiastic and motivated person who can use initiative when working as part of a team or individually, to meet challenging deadlines and objectives. I have a strong interest in designing applications and problem solving which is why I followed a career in Software Engineering. I am a full stack developer with valuable experience across several Backend and Frontend tech stacks. My strengths lie with JavaScript, Typescript, Node, Java, AWS, PostgreSQL and React.

TECHNICAL SKILLS

TECHNOLOGIES	METHODOLOGIES	CERTIFICATIONS
• NodeJS • React • TypeScript • ExpressJS • Docker • CI/CD (Jenkins, Github CI) • GitHub • HTML/CSS • AWS • Docker • Cloudformation	• Agile • Kanban	• BEng (Hons) Software Engineering

WORK EXPERIENCE

Unosquare, Software Engineer (March 2022 – Present)

FMI

Lead Backend Software Engineer — Application Manager platform (FMI): a multi-service, microservice API platform that validates and verifies software teams' release readiness and deployment evidence.

- Delivered backend features across a microservices REST API platform spanning Java/Spring Boot and Node.js/TypeScript services, supporting automated verification of engineering teams' software releases.
- Configured Kafka consumers within Java Spring Boot services to process asynchronous message streams that feed the platform's ingestion and verification pipelines.
- Designed and built net-new services end-to-end — from data model and database schema through to REST API used to verify and evidence software teams' deployments.
- Owned the data-service, the platform's central persistence and API layer: a Node.js/Express service using the Prisma ORM over PostgreSQL and used as a source of truth for the entire application.
- Opportunity to develop agentic workflows within a software system and provide agentic skill to improve workflows within teams and streamline pain points within the SDLC.
- Created new AWS resources for new micro services including setting up cloudformation for infrastructure as code, secret management, S3 creation and maintenance and IAM based roles associated to AWS resources used by the service.
- Hands on experience writing and maintaining a full suite of frontend and backend integration tests for complete E2E testing and verification of new features developed across all microservices and UI.

Unosquare, Software Engineer (March 2022 – June 2022)

Flex

During flex I worked on a Typescript React front end and Golang with gofiber backend. I was able to work on tickets that required fullstack development from database modifications to data retrieval and backend business logic to the react front end changes required. There was no QA on the team and we had to take full ownership of the development making sure the validation and test cases were covered and that the acceptance criteria was successfully met. The technologies I used day to day were:

Golang with gofiber and sql.db

- Typescript with React, React Query and Material UI
- Flyway with MySql
- AWS
- Docker
- Jira & Confluence

Unosquare, Software Engineer (November 2021 – March 2022)

Center of Excellence

During the centre of excellence at Unosquare I made a full stack Javascript project which was then later converted to Typescript. This involved:

- Building out a project scope, functional requirements and roadmaps for the training time.
- ERD creation and Database design
- Flyway for database migrations
- Node API created with Prisma and Express
 - Authentication with JWT
 - Validation with express validator
 - OpenAPI specification added with swagger
- React application using MaterialUI
- Github actions for CI/CD
- AWS using S3, lightsail and RDS.

Payroc, Software Engineer (July 2021 – November 2021)

- Provide technical support to clients

Philips, Associate Software Engineer (June 2019 – July 2020)

- Developed web applications used to assist pathologists in the diagnosis of Cancer through AI algorithms.
- Front End development using Angular and React
- Back End API development using C# and Express JS
- Development of Unit Tests with Test Driven Development
- Exposure to Docker, Kubernetes, Jenkins & Firebase

Personal Information:

- Driver, clean licence
- Over the past year I have also worked on developing software solutions for yacht clubs around Strangford Lough and businesses across Northern Ireland, a portfolio of websites created can be found at <https://nc-web-solutions.com/>
- DOB: 25.10.1998
- Interests include: Sailing, running, golf, rock climbing and programming
